

CONFIDENTIAL · JULY 2026

NEMO

Neobank in a box. Everything needed to launch and run a digital bank — deployed in a day, on any cloud or on-premise, operated by AI.

CORE BANKING

LENDING

PAYMENTS

CARDS

AI OPERATIONS

|| THE PROBLEM

Launching a digital bank still takes years and tens of millions — especially where it's needed most.

BUILD IT YOURSELF

3–5 years, \$10M+

Core ledger, compliance, fraud, apps — before the first customer. Most attempts die in integration.

BUY A SAAS CORE

A core is not a bank

Mambu-class platforms ship a ledger, then hand you to system integrators for 6–18 months. No app, no ops, no market fit.

EMERGING-MARKET REALITY

Global stacks don't fit

Mobile money rails, credit bureaus, local regulators and data-residency law are afterthoughts in Western platforms.

THE MODEL IS PROVEN

Credit-led neobanks work in emerging markets. Nobody sells the box.

Fintech Farm (Leobank, Liobank, Simbank, Roarbank) proved the formula across six markets: partner with a licensed local bank, ship an app customers love, grow on AI-underwritten credit. But they *operate* each neobank themselves — the playbook doesn't scale beyond their own ventures.

vendors offering that full stack as a product an operator can run themselves
the gap Nemo fills

Nemo is the whole bank, **in one box.**

CORE

Current, savings, wallet & term deposit accounts with interest engines and a full double-entry general ledger (IFRS 9, maker-checker, tamper-evident audit).

CREDIT

Product factory → origination → schedules, penalties, collections, write-off. Overdrafts and BNPL included.

PAYMENTS

Mobile-money-native transfers, P2P by phone number, bills & airtime, cards via issuer processors.

RISK & AI

AI credit scoring, ML fraud detection with case management, AML monitoring and SAR workflows.

COMPLIANCE

Regulatory reporting shipped per market — central-bank returns, credit-bureau submissions, data protection.

CHANNELS

White-label customer mobile app, web banking, USSD and agent network, plus the staff back-office console.

TREASURY

Float management, reconciliation against every rail, settlement with the partner bank.

OPERATIONS

Monitoring, alerting and AI ops agents at every level — infrastructure to ledger integrity.

16 event-driven microservices, one platform. The regulated back half is **built and hardened today** — audited money paths, 230+ automated API tests, live-grade Kenya deployment.

A bank customers **love to hold.**

White-label and brand-packed per tenant: same platform, each neobank's own name, colours and products. Three moments from the concept design —

EVERYDAY MONEY

VIRTUAL CARDS, DAY ONE

CREDIT-LED GROWTH

Symbiosis by design: the clownfish and the anemone.

A clownfish thrives inside the anemone's protection; the anemone thrives on what the clownfish brings. Nemo runs the same way: the digital bank lives inside a licensed partner's regulatory shelter, and brings it customers, deposits and lending income.

THE ANEMONE — LICENCE HOLDER

Partner bank / MFI / DCP

Holds the licence, the prudential capital and the settlement accounts. Keeps its core of record if it wants.

THE CLOWNFISH — NEMO TENANT

One tenant = one neobank

Its own customers, products, ledgers, brand and reports — isolated on a shared platform. One installation runs many banks.

Launching a neobank is configuration, not a project:

1 · Provision tenant → 2 · Pick a **market pack** (currency, rails, KYC, tax, regulator) → 3 · Configure products → 4 · Apply **brand pack** → a **running, compliant bank**.

|| DEPLOY ANYWHERE

One click to a bank — on our cloud, your cloud, or your basement.

ONE-COMMAND INSTALL

The entire platform — services, databases, event bus, observability — ships as a single Kubernetes package with sane defaults. Sandbox bank in under an hour.

ON-PREMISE & AIR-GAPPED

Data-residency laws in our markets make on-prem a feature, not a compromise. Offline bundles, licence activation, no phone-home required.

DAY-2 AUTOMATED

Zero-downtime upgrades, gated migrations, backups with tested recovery objectives, multi-node HA. Banks don't take maintenance windows.

Config over code — the iron rule. A new country is a market pack; a new savings product is product-factory data; a new brand is a theme. Nothing a regulator or product manager changes requires an engineer.

The bank mostly **runs itself**. Humans set policy and review by exception.

AI DECIDES THE MONEY

- **Straight-through credit** — apply → score → disburse with zero human touch for in-policy cases, explainable declines for regulators
- **Fraud & AML** — ML detection with AI triage that drafts cases and SARs for officer sign-off
- **Collections** — risk-based strategy, best time & channel to contact, hardship detection

AI RUNS THE SYSTEM

- **Ops agents** — watch telemetry and business metrics, diagnose event lag and reconciliation breaks, execute runbooks behind approval gates
- **Customer AI** — support chat with real banking actions, personalised nudges, churn prediction
- **Governed** — every model registered, monitored for drift, bias-tested, overridable, with a kill switch

One decision engine logs every automated call the bank makes, with its reasons — **automation a bank's risk committee can sign.**

||| WHY US

We're not starting — the hard half is built.

Most neobank stacks begin with the app and hit the wall at the ledger. Nemo grew the other way: it began as a bank-grade lending & deposits platform under a real regulator, and the app is the last mile.

16

event-driven microservices,
one Go monorepo

2×

entry accounting — every
shilling balanced, IFRS 9
provisioned, audit-trailed

6

markets already validated for the credit-
led neobank model by the reference
operator

fintech-farm.com

Beachhead: East Africa. Kenya is live-grade today; Ethiopia — a banking market of 120M people just opening to digital finance — is the first market-pack expansion. Then the proven emerging-market band: West Africa, MENA, Central & Southeast Asia.

Buyers: tier-2/3 banks going digital · MFIs and digital credit providers upgrading to bank-grade · licensed fintechs & telcos · neobank venture operators who want the box without building it.

Licence the box. Share the upside.

Per-tenant platform licence (cloud subscription or on-prem term), metered by active customers and modules — with an optional revenue-share on lending income that aligns us with the operator, the way the reference model aligns with its partner banks.

	NEMO	FINTECH FARM	SAAS CORES	LEGACY CORES
Full stack incl. consumer app	✓	✓ self-operated only	✗ core only + SI	partial
On-premise / data residency	✓	✗	limited	✓ heavy
Time to launch	days-weeks	months, theirs to run	6–18 months	18 months+
AI-native operations	✓ core design	credit only	✗	✗
Emerging-market packs	✓ built in	✓ bespoke	per-project	✗

The wedge: the only neobank-complete platform an emerging-market operator can run themselves, on their own infrastructure, with AI doing the operational heavy lifting.

Package it. Show it. Let it run itself.

PHASE 1 · THIS QUARTER

Package

- One-command Kubernetes install
- Tenant provisioning: "create neobank" end-to-end
- Market-pack framework — Kenya extracted as pack #1
- Full-stack observability: tracing, business-metric alerting, SLOs
- Self-service eKYC onboarding APIs
- Unified, explainable decision engine v1

PHASE 2 · QUARTERS 2-3

The visible neobank

- White-label customer app: accounts, P2P, bills, loans
- Virtual cards via issuer processor
- Savings pots, scheduled payments, deposit lifecycle
- Reconciliation engine across all rails
- Straight-through credit + model governance
- On-prem installer, zero-downtime upgrades, HA/DR

PHASE 3 · QUARTER 4+

AI-operated & ecosystem

- Ops agents: diagnose & remediate behind approval gates
- AI collections, AML copilot, customer AI with actions
- USSD + agent network channel
- Market pack #2: Ethiopia — proving config-over-code
- Public API platform & developer portal
- Tenant metering & platform billing

Standing tracks throughout: money-path audits · security posture · PCI-DSS
→ ISO 27001 → SOC 2 certification programme.

Every market that needs a bank should be **one click away** from one.

The regulated core is built. The model is proven. What remains is packaging and the last mile to the customer's hand — and that is exactly what the next three quarters deliver.
